

Topic: Classes and Object

We discussed class Point in the class yesterday! (you can refer to code in Canvas)

You need to read point from point.txt.
point.txt has comma separated integer

Example

12,13

You need to write function distance inside the class Point, that returns the distance of a point from origin.

(Use cout)

Output the point closest to the origin. If there are multiple such points, Output all of them.

NOTE: Like you can create an array of struct, you can also create an array of objects.
